The use of Radio Frequency (RF) technology for the warehouse is growing. You need access to your information from anywhere in your warehouse! integraSoft’s RF Mobile Warehouse solution provides your staff the access they need to answer their important questions from any location in your warehouse. integraRF offers a number of RF-based capabilities to improve productivity and increase inventory accuracy.

**BENEFITS OF RF SCANNING**

- Increase Productivity
- Eliminate Picking Errors
- Real-Time Tracking of Bin Movement
- Recognize Real-Time Quantity Receiving
- Improve Cycle Count Efficiency

**PACK & SHIP - VERIFY CUSTOMER ORDER CONTENTS**

Use this feature during picking or after your picking function is complete. Use an Order-Verification step during your packing process to ensure all items were picked correctly. After the verification step is performed, the packer is notified of any discrepancies. If an item is shipped short and it appears it is in stock, your packer has the ability to handle this error immediately.

**ENTER & RECEIVE PURCHASE ORDERS**

During the Purchase Orders Receiving process, you can scan the bar coded products, confirm the items, and ensure the quantities matched what was shipped.

**PUT AWAY**

Use the integraERP RF Mobile software to move your product from the receiving location to the Picking or Overflow locations.
Maximize warehouse efficiency, increase productivity and improve accuracy with the key concepts of integraRF.

Real-time data capture at the origination point of the transaction.

Improve accuracy of both your employees and status of your inventory quantities and locations.

**CYCLE COUNT**

Based on rules you set up, the integraERP software determines which products should be counted. Use the integraRF software to count the selected Bin Locations.

Simply scan the product Bar Code and enter the quantity. The easy-to-use integraRF software will improve cycle count efficiency and accuracy of your counts.

**VERIFY & RECEIVE WAREHOUSE TRANSFERS**

During the Warehouse Transfer Shipping process, you can scan the bar coded products, confirm the items were properly picked, and ensure the quantities match what was ordered.

When the order arrives at your remote warehouse, simply scan the bar coded products, confirm the quantities, and easily receive the merchandise into the receiving inventory.

**PRODUCT LOCATION / BIN MOVEMENT**

The placement of your product in your warehouse is not stationary. Your product is changing locations all the time. integraRF has capabilities that allow your system to keep up with these movements. Easily scan the product and scan the location you are moving it to. The location change is logged real-time in your integraERP system.

**SETUP UPC/CROSS REFERENCE CODES**

You can use the integraRF technology to setup your UPC/Cross Reference codes. Enter your product number and scan the UPC/Cross Reference number. The UPC is now recorded real-time in your integraERP system for all users to see.

**CAPABILITIES THAT GROW WITH YOUR COMPANY**

integraSoft is here to help you, reduce shipping errors, improve customer satisfaction through accurate shipping, and lower warehouse costs through more efficient processes. You can transition each warehouse function individually or all at one time. integraRF is designed to grow with your needs.
